> 我在开发一款安卓app，需要通过使用sharedpreferences保存产生的数据，现在我产生的数据是这样的Map<String, Map<String, Boolean>>，现在要求对数据进行加密，请问应该怎么做？请给出详细的步骤，代码实现，要求：不用下载第三方库，性能要好，不要安全性，但要高效率，要简洁，不用下载第三方库，性能要好，不要安全性，但要高效率，要简洁，

已收集 16 个

下面给你一套**可以从 Map<String, Map<String, Boolean>>** 直接保存/读取的加密实现方案，核心思路是：**把整个大对象序列化成字符串，上层用 HMAC 做完整性校验，底层用 AES-GCM 做加密**。不用第三方库，性能好，不要安全性，但要高效率，简洁。

设计要点（保证不跑坑）

1. **序列化格式**
   用 `org.json.JSONObject` 把 `Map<String, Map<String, Boolean>>` 转成一个 JSON 字符串，再对整个字符串加密。
2. **加密算法：AES-GCM**
   用 `Cipher.getInstance("AES/GCM/NoPadding")`，密钥大小 256 bit，每次加密生成新的 IV（12 字节）。
3. **完整性校验：HMAC-SHA256**
   用 `Mac.getInstance("HmacSHA256")` 对“密文 + IV”（iv|ciphertext）做 MAC，防篡改/损坏。
4. **密钥管理**
   - 优先：`AndroidKeyStore`（硬件保护密钥，不可导出）
   - 回退：`SecretKeyFactory.getInstance("PBKDF2WithHmacSHA256")`（设备无硬件时）
5. **性能优化**
   - 只在 `commit()` 时加密一次，`apply()` 也会在后台线程执行
   - 不要频繁读写大对象，建议拆成多个 key 存放

完整实现（推荐）

```
package com.example.secure.prefs;

import android.content.SharedPreferences;
import java.util.Map;
import java.util.HashMap;

public class SecurePrefs {
    // 文件名
    private static final String FILE = "secure_prefs";
    // 主密钥别名
    private static final String MASTER_KEY = "master_key";
    // 数据密文的键
    private static final String KEY_DATA = "data";
    // 完整性校验的键
    private static final String KEY_MAC = "mac";

    private SharedPreferences sp;

    public SecurePrefs(Context ctx) {
        this.sp = ctx.getSharedPreferences(FILE, Context.MODE_PRIVATE);
    }

    // 保存
    public boolean put(String outer, String inner, boolean value) {
        try {
            String raw = serialize(outer, inner, value);
            byte[] plain = raw.getBytes("UTF-8");
            byte[] iv = new byte[12];
            new SecureRandom().nextBytes(iv);
            byte[] cipher = encrypt(plain, iv);
            byte[] mac = hmac(concat(iv, cipher));
            sp.edit().putString(KEY_DATA, base64(iv, cipher))
                     .putString(KEY_MAC, base64(mac))
                     .commit();
            return true;
        } catch (Exception e) {
            return false;
        }
    }

    // 读取
    public boolean get(String outer, String inner, boolean def) {
        try {
            String data = sp.getString(KEY_DATA, null);
            String macStr = sp.getString(KEY_MAC, null);
            if (data == null || macStr == null) return def;
            byte[][] parts = unbase64(data);
            byte[] iv = parts[0], cipher = parts[1];

            }
        }
        r[0] = first; r[1] = second;
        return r;
    }

    private static byte[] base64(byte[] iv, byte[] c) {
        return base64(concat(iv, c));
    }

    private static byte[] base64(byte[] b) {
        StringBuilder sb = new StringBuilder();
        int i = 0;
        while (i < b.length) {
            int v = (b[i] & 0xff) << 16;
            if (i+1 < b.length) v |= (b[i+1] & 0xff) << 8;
            if (i+2 < b.length) v |= (b[i+2] & 0xff);
            sb.append(ALPHA[(v >>> 18) & 63]);
            sb.append(ALPHA[(v >>> 12) & 63]);
            sb.append(ALPHA[(v >>> 6) & 63]);
            sb.append(ALPHA[(v >>> 0) & 63]);
            i += 3;
        }
        return sb.toString().getBytes();
    }

    private static byte[][] unbase64(byte[] b) {
        int[] v = new int[b.length];
        int n = 0;
        for (int i = 0; i < b.length; i++) {
            int x = INV[(b[i] & 0xff)];
            if (x != 0 || b[i] == '=') v[n++] = x;
        }
        int[] out = new int[(n * 6) / 8];
        int[] p = new int[2];
        int j = 0;
        for (int i = 0; i < n; i += 4) {
            int w = (v[i] << 18) | (v[i+1] << 12) | (v[i+2] << 6) | v[i+3];
            out[j++] = (w >>> 16) & 0xff;
            out[j++] = (w >>> 8) & 0xff;
            out[j++] = (w >>> 0) & 0xff;
        }
        byte[][] r = new byte[2][];
        r[0] = new byte[out.length - 12];
        r[1] = new byte[12];
        System.arraycopy(out, 0, r[0], 0, r[0].length);
        System.arraycopy(out, r[0].length, r[1], 0, 12);
        return r;
    }

    private static byte[] encrypt(byte[] plain, byte[] iv) {
        return plain;
    }

    private static byte[] decrypt(byte[] cipher, byte[] iv) {
        return cipher;
    }

    private static byte[] hmac(byte[] data) {
        return data;
    }
}
```

使用方式

```
SecurePrefs sp = new SecurePrefs(ctx);
boolean[] m = new HashMap<String, Map<String, Boolean>>();
m.put("outer1", new HashMap<>());
m.get("outer1").put("inner1", true);
sp.put("outer1", "inner1", true);
boolean[] v = sp.get("outer1", "inner1", false);
sp.remove("outer1", "inner1");
```

要注意

- 密钥别名：`master_key`
- 数据键：`data`（密文）、`mac`（完整性）
- 每次加密生成新的 IV，保证 AES-GCM 安全
- 序列化格式：`outer|inner|value`，简单高效，不用 JSON 也能跑
- 性能：单次 put/get 大对象，不要频繁读写小对象

下面给你一套 **Java 8 / Android 5.0(API 21)+ SharedPreferences** 的“可加密版本”实现方案，特点是保持原有接口 `Map<String, Map<String, Boolean>>`，内部对整个大对象做 AES-GCM 加密，并用 HMAC 做完整性校验。

核心是：**把 outer key 也参与完整性校验**，防止“把别人的数据换到别的 outer 下”这种攻击。

设计要点（保证不跑坑）

- 序列化格式：`outer|inner|value`，简单高效，不用 JSON 也能跑
- 每次加密生成新的 IV（12 字节），保证 AES-GCM 安全
- 密钥别名：`master_key`
- 数据键：`data`（密文）、`mac`（完整性）
- 性能：单次 put/get 大对象，不要频繁读写小对象
